Projects

- **MazeMind – Adaptive AI Maze Game** — *May 2026 – Jun 2026*
  C#, Unity, ScriptableObjects, URP, Git
  - Designed an **AI Director** tracking deaths, time-in-section, and hazard hits, using priority-sorted `AdaptationRuleSO` ScriptableObjects to retune hazard density, gem placement, and key spawns – with `AdaptationState` as a shared event bus decoupling the Director from per-room logic.
  - Integrated a **procedural CheckboxFloorGenerator** producing connected solvable mazes and an in-game `DecisionLogger` capturing every adaptation event for replay and rule tuning; owned **Room 1 end-to-end** (3 sections, spawn points, section triggers, win/lose flow) integrating teammate-authored enemy mechanics.
  - Validated AI Director rule firing across all difficulty transitions through 20+ playthroughs; the full game shipped with **3 playable rooms** featuring escalating mechanics – bullet traps, sliding platforms, forced-fall sequences, and NPC enemies.
- **FactLens – Agentic Misinformation Detector** — *MumbaiHacks 2025*
  Python, FastAPI, Groq LLaMA 3.1, Knowledge Graphs, Docker
  - Built a **two-stage claim verification pipeline** labeling social posts True/False/Partly True at up to **96% confidence**, by chaining two Groq LLaMA 3.1 agents – one for claim extraction, one for evidence-grounded verdict reasoning.
  - Prevented out-of-evidence hallucinations by constraining LLM verdict reasoning strictly to a **structured knowledge graph** (`kg.json`) via prompt-level context blocking; tested across True/False/Partly-True scenarios on a synthetic crisis dataset.
  - Structured the repo with a clean `backend/ extension/ assets/` split for parallel team development and containerized the backend via **Docker** for single-command local setup.
- **OmniDict – Distributed Sharded KV Store** — *Jun 2025 – Aug 2025*
  Go, gRPC, Protocol Buffers, HashiCorp Raft, Consistent Hashing, Docker
  - Verified **zero data loss under single-node failure** on a 3-node quorum by building a **kill-node test CLI** that performs mid-operation node termination and confirms all committed writes survive via subsequent `Get` calls.
  - Implemented a **consistent-hash ring** guaranteeing **≤25% key remapping** on node join/leave by design; verified distribution behavior by running rebalance operations against a live cluster.
  - Implemented the **gRPC server and CLI client** (`Put`, `Get`, `Join`, `Delete`, `TTL`) using Protocol Buffers, and authored the **Docker Compose** setup enabling one-command spin-up of a 3–5 node cluster for reproducible failure testing.

Skills

Languages: Python, GoLang, C#, Java, JavaScript, SQL
Frameworks: FastAPI, gRPC, Protobuf, HashiCorp Raft, Multi-Agent Pipelines, RAG, Knowledge Graphs
Tools: Git, Docker, GitHub Actions, Linux, Unit Testing
Platforms: MySQL, Oracle SQL, Unity

Achievements

- Secured **AIR 646** in KIITEE Entrance Exam and awarded a **$5000** scholarship
- **Top 30 Finalist** at Tech Zephyr 2025, IIT Bhubaneswar
- **Top 50**, Silicon Labs IoT Challenge 2026 – Smart Healthcare with Edge AI track
- **Top 500 / 3,000+ teams** at MumbaiHacks 2025, Multi-Agent AI track

Education

Kalinga Institute of Industrial Technology (KIIT) — Bhubaneswar, India
B.Tech in Computer Science Engineering, CGPA: 9.26/10 — *Aug 2024 – Oct 2028*
- *Coursework:* DSA, OOPs (Java), OS, COA, DBMS

Delhi Public School, Ruby Park — Kolkata, India
AISSCE (Class XII, Science), Percentage: 95% — *Aug 2022 – Jun 2024*

The BSS School — Kolkata, India
WBBSE (Class X), Percentage: 89% — *Jan 2009 – Jun 2022*
